## Geometric Probability

Up to this point, we have determined the probability of events, based solely on lists of information. Geometric probability is the probability of choosing a point at random from a specific area of space. Basically, it works like this:

$$
\text { Geomtric Probabilty }=\frac{(\text { Area of shape that I) WANT }}{(\text { Area of outer shape, which is the }) \text { TOTAL }}
$$

First, we are going to practice determining area, as we will need that to determine probability.
EXAMPLE: What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

| 20 | 8 | Sample Space |  |  | The rest of the outer shape (the big rectangle) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | $\text { total }-(\text { rect's })$ |
|  |  | Amount (Area) | $b h=(9)(1)=9$ | $b h=(9)(2)=18$ | $\begin{gathered} =160-(9+18) \\ =133 \end{gathered}$ |
| $2 \quad 9$ |  | Sample Size <br> (Total) $\square$ | $\begin{aligned} b h & =(20)(8) \\ & =160 \end{aligned}$ | $\leftarrow$ same $=160$ | $\leftarrow$ same $=160$ |
|  |  | Probability | $\frac{9}{160}$ | $\frac{18}{160}=\frac{9}{80}$ | $\frac{133}{160}$ |

$P($ Rectangle 1 or Rectangle 2$)=\frac{27}{160} \quad P($ NOT Rectangle 1 or Rectangle 2$)=\frac{133}{160}$
EXAMPLE: What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

| $16$ | Sample Space |  | The rest of the outer shape (the big triangle) |
| :---: | :---: | :---: | :---: |
|  | Amount (Area) | $b h=(11)(2)=22$ | $\begin{gathered} \text { total }- \text { rectangle } \\ =176-(22)=154 \end{gathered}$ |
| 22 <br> Tick marks mean "the same." So, each of these pieces have | Sample Size <br> (Total) <br> 16 | $\frac{b h}{2}=\frac{(16)(22)}{2}=176$ | $\leftarrow$ same $=176$ |
| $11+11=22$ | Probability | $\frac{22}{176}=\frac{11}{88}=\frac{1}{8}$ | $\frac{154}{176}=\frac{7}{8}$ |
| $P(\text { Rectangle })=\frac{1}{8} \quad P(N O$ |  |  |  |

1. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

| Sample Space | $\square \mathbf{2}$ | The rest of the total figure |
| :---: | :---: | :---: |
| Amount (Area) |  |  |
| Sample Size |  |  |
| $\square$ |  |  |
| Probability |  |  |

2. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

| 23 | Sample Space |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\stackrel{4}{ } 3^{10}$ | Amount (Area) |  |  |  |
|  | Sample Size |  |  |  |
|  | Probability |  |  |  |

3. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

4. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement? (Use the area in terms of pi.)

| Sample Space | $\mathbf{r}=\mathbf{3}$ | $\overbrace{}^{\mathbf{r}=\mathbf{3}}$ |  |
| :--- | :--- | :--- | :--- | :--- |
| Amount (Area) | $\pi r^{2}=$ | $\pi r^{2}=$ |  |
| Sample Size |  |  |  |
| Probability |  |  |  |

5. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

6. What is the probability that a randomly selected point will be in the shaded part(s)? What is the probability of the complement?

Geometric Probability Answers

| 1. $\frac{3}{28}$ | 2. $\frac{6}{115}$ | 3. $\frac{1}{6}$ |
| :--- | :--- | :--- |
| 4. $\frac{2}{25}$ | 5. $\frac{7}{24}$ | 6. $\frac{2}{5}$ |
