

Writing Quadratics in Factored Form

Today, we will be looking at two aspects of quadratics:

- How to write a standard form quadratic ($ax^2 + bx + c$) in factored form.
Remember: To factor a 3-term quadratic, you must first split the middle term by answering the questions
What is $A \cdot C$? What is B ? What set of two numbers will multiply to $A \cdot C$, and add to B ?
- How the intercepts of a quadratic are related to both standard and vertex forms.

EXAMPLE: Write in factored form.

$$a(x) = x^2 + 5x - 14$$

Solve the Puzzle:

$$A \cdot C = (1)(-14) = -14$$

$$\& B = 5$$

$$\underline{7} \cdot \underline{-2} = -14$$

$$\& \underline{7} + \underline{-2} = 5$$

Split Bx using 7 & -2 :

$$+7x - 2x$$

$$a(x) = x^2 + 7x - 2x - 14$$

Group & Factor:

$$a(x) = \underline{x^2 + 7x} - \underline{2x - 14}$$

$$a(x) = 1x(x + 7) - 2(x + 7)$$

$$a(x) = (x + 7)(1x - 2)$$

$$\boxed{a(x) = (x + 7)(x - 2)}$$

Factors: $\boxed{(x + 7)(x - 2)}$

X-intercept(s): $\boxed{(-7, 0) \& (2, 0)}$

Y-intercept: $\boxed{(0, -14)}$

Vertex: $\boxed{(-2.5, -20.25)}$

EXAMPLE: Write in factored form.

$$b(x) = 5x^2 - 23x + 12$$

Solve the Puzzle:

$$A \cdot C = (5)(12) = 60$$

$$\& B = -23$$

$$\underline{-20} \cdot \underline{-3} = 60$$

$$\& \underline{-20} + \underline{-3} = -23$$

Split Bx using -20 & -3 :

$$-20x - 3x$$

$$b(x) = 5x^2 - 20x - 3x + 12$$

Group & Factor:

$$b(x) = \underline{5x^2 - 20x} - \underline{3x + 12}$$

$$b(x) = 5x(x - 4) - 3(x + 4)$$

$$b(x) = \boxed{(x - 4)(5x - 3)}$$

Factors: $\boxed{(x - 4)(5x - 3)}$

X-intercept(s): $\boxed{(0.6, 0) \& (4, 0)}$

Y-intercept: $\boxed{(0, 12)}$

Vertex: $\boxed{(2.3, -14.45)}$

EXAMPLE: Write in factored form.

$$c(x) = 4x^2 - 4x - 8$$

Puzzle:

$$A \cdot C = (4)(-8) = -32$$

$$\& B = -4$$

$$\underline{-8} \cdot \underline{4} = -32$$

$$\& \underline{-8} + \underline{4} = -4$$

Split Bx using -8 & 4 :

$$-8x + 4x$$

$$b(x) = 4x^2 - 8x + 4x - 8$$

Group & Factor:

$$b(x) = \underline{4x^2 - 8x} + \underline{4x - 8}$$

$$b(x) = 4x(x - 2) + 4(x - 2)$$

$$b(x) = (x - 2)(4x + 4)$$

$(4x+4)$ can be factored...
take out the 4: $4(x+1)$

$$b(x) = \boxed{4(x - 2)(x + 1)}$$

Factors: $\boxed{4(x - 2)(x + 1)}$

X-intercept(s): $\boxed{(-1, 0) \& (2, 0)}$

Y-intercept: $\boxed{(0, -8)}$

Vertex: $\boxed{(0.5, -9)}$

1. Write in factored form.

$$f(x) = x^2 + x - 12$$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

2. Write in factored form.

$$g(x) = 2x^2 - 9x - 5$$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

3. Write in factored form.

$$h(x) = -x^2 - 2x + 24$$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

4. Write in factored form.

$$k(x) = 4x^2 + 13x + 10$$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

5. Write in factored form.

$$m(x) = x^2 - 10x + 25$$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

6. Write in factored form.
 $n(x) = -x^2 - 7x - 10$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

7. Write in factored form.
 $p(x) = 3x^2 - 9x - 12$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

8. Write in factored form.
 $q(x) = x^2 - 7x - 18$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

9. Write in factored form.
 $r(x) = x^2 - 9$
 Use Difference of Squares, OR
 Think of it as:
 $r(x) = x^2 + 0x - 9$

Factors:

X-intercept(s):

Y-intercept(s):

Vertex:

What do you notice about the factors and the x-int's?

What do you notice about standard form and the y-int?

10.

X-intercept(s):

Y-intercept(s):

Vertex:

Using the patterns you noticed above, what would you guess that the factors are?
