

Linear vs. Quadratic & Writing Equations from Tables

Determining if a function is linear or quadratic from a table:

If the first differences are the same, then it is linear. If the second differences are the same, then it's quadratic.

Linear	Quadratic																								
<p>Determine if the function is linear or quadratic.</p> <table border="1" style="display: inline-table; margin-right: 10px;"> <tr><td>x</td><td>y</td></tr> <tr><td>1</td><td>7</td></tr> <tr><td>2</td><td>4</td></tr> <tr><td>3</td><td>1</td></tr> <tr><td>4</td><td>-2</td></tr> <tr><td>5</td><td>-5</td></tr> </table> <p>1st Fill in the blanks: -3 -3 -3 -3</p> <p>The function is linear because it has a 1st difference that is constant.</p>	x	y	1	7	2	4	3	1	4	-2	5	-5	<p>Determine if the function is linear or quadratic.</p> <table border="1" style="display: inline-table; margin-right: 10px;"> <tr><td>x</td><td>y</td></tr> <tr><td>1</td><td>9</td></tr> <tr><td>2</td><td>3</td></tr> <tr><td>3</td><td>1</td></tr> <tr><td>4</td><td>3</td></tr> <tr><td>5</td><td>9</td></tr> </table> <p>1st 2nd Fill in the blanks: -6 +4 -2 +4 +2 +4 +6 +4</p> <p>The function is quadratic because it has a 2nd difference that is constant.</p>	x	y	1	9	2	3	3	1	4	3	5	9

Determine if the function is Linear or Quadratic. Use the word bank to fill in the blanks.

The function is _____ because it has a _____ that is _____.

Possible responses are:	Linear or Quadratic	1 st difference or 2 nd difference	constant
-------------------------	-------------------------	--	----------

<p>EXAMPLE</p> <table border="1" style="display: inline-table; margin-right: 10px;"> <tr><td>x</td><td>y</td></tr> <tr><td>1</td><td>-15</td></tr> <tr><td>2</td><td>-8</td></tr> <tr><td>3</td><td>-1</td></tr> <tr><td>4</td><td>6</td></tr> <tr><td>5</td><td>13</td></tr> </table> <p>1st 2nd +7 +7 +7 +7 +7 +7</p> <p><i>1st diff. is +7 ..because -15+7=-8 -8+7=-1 -1+7=6 6+7=13</i></p> <p>The function is linear because it has a 1st difference that is constant.</p>	x	y	1	-15	2	-8	3	-1	4	6	5	13	<p>EXAMPLE</p> <table border="1" style="display: inline-table; margin-right: 10px;"> <tr><td>x</td><td>y</td></tr> <tr><td>1</td><td>2</td></tr> <tr><td>2</td><td>16</td></tr> <tr><td>3</td><td>24</td></tr> <tr><td>4</td><td>26</td></tr> <tr><td>5</td><td>22</td></tr> </table> <p>1st 2nd +14 -6 +8 -6 +2 -6 -4 -6</p> <p>The function is quadratic because it has a 2nd difference that is constant.</p>	x	y	1	2	2	16	3	24	4	26	5	22	<p>1.</p> <table border="1" style="display: inline-table; margin-right: 10px;"> <tr><td>x</td><td>y</td></tr> <tr><td>1</td><td>10</td></tr> <tr><td>2</td><td>3</td></tr> <tr><td>3</td><td>4</td></tr> <tr><td>4</td><td>13</td></tr> <tr><td>5</td><td>30</td></tr> </table> <p>The function is _____ because it has a _____ that is _____.</p>	x	y	1	10	2	3	3	4	4	13	5	30

Writing the Equation from a Table

A linear equation uses the formula $f(x) = mx + b$, so you need to find m & b .

A quadratic equation uses the formula $f(x) = ax^2 + bx + c$, so you need to find $a, b, & c$.

Steps for writing the Linear equation...	Linear Example																		
<p>Step 1: Find the 1st differences.</p>	<table border="1"> <thead> <tr> <th>x</th> <th>y</th> <th>1st</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>7</td> <td>-3</td> </tr> <tr> <td>2</td> <td>4</td> <td>-3</td> </tr> <tr> <td>3</td> <td>1</td> <td>-3</td> </tr> <tr> <td>4</td> <td>-2</td> <td>-3</td> </tr> <tr> <td>5</td> <td>-5</td> <td>-3</td> </tr> </tbody> </table> <p style="text-align: center;">↑ That gives us this ↓</p>	x	y	1 st	1	7	-3	2	4	-3	3	1	-3	4	-2	-3	5	-5	-3
x	y	1 st																	
1	7	-3																	
2	4	-3																	
3	1	-3																	
4	-2	-3																	
5	-5	-3																	
<p>Step 2: Find the leading coefficient (the first number in the equation), m.</p> <p>Here's how When it's <u>linear</u>, $f(x) = mx + b$, the leading coefficient is:</p> $m = \frac{1st\ difference}{1}$	<p>When it's linear, use:</p> $f(x) = mx + b$ $m = \frac{first\ difference}{1}$ $m = \frac{-3}{1}$ $m = -3$ <p>My equation so far:</p> $f(x) = mx + b$ $f(x) = -3x + b$																		
<p>Step 3: Find the constant (the last number in the equation-the one that doesn't have an x), b.</p> <p>Here's how The constant (b) is where x is 0.</p> <p>So, use the differences to find what y would be if x were 0.</p>	<p>$b = y$ when $x = 0$ (use the 1st difference to get 0)</p> <p>I know that the y-value at $x = 0$ is b, and that it will go down 3 units to become 7 (the y-value at $x = 1$). So...</p> <table border="1"> <thead> <tr> <th>x</th> <th>y</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>b</td> </tr> <tr> <td>1</td> <td>7</td> </tr> </tbody> </table> <p style="text-align: center;">-3</p> $b - 3 = 7$ $b = 10$ <p>My equation so far:</p> $f(x) = -3x + b$ $f(x) = -3x + 10$ <p>I'm done! The equation of this line is: $f(x) = -3x + 10$.</p>	x	y	0	b	1	7

<p>Finally, use the point (1, 9) to solve for <i>b</i>. (Plug them in)</p>	<p>(1, 9) → $f(x) = 2x^2 + bx + 19$ $9 = 2(1)^2 + b(1) + 19$ $9 = 2 + 1b + 19$ $9 = b + 21$ $-12 = b$</p> <p>So, my equation is: $f(x) = 2x^2 - 12x + 19$</p>	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr><th>x</th><th>y</th></tr> <tr><td>1</td><td>7</td></tr> <tr><td>2</td><td>11</td></tr> <tr><td>3</td><td>17</td></tr> <tr><td>4</td><td>25</td></tr> <tr><td>5</td><td>35</td></tr> </table>	x	y	1	7	2	11	3	17	4	25	5	35	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr><th>x</th><th>y</th></tr> <tr><td>1</td><td>3</td></tr> <tr><td>2</td><td>13</td></tr> <tr><td>3</td><td>19</td></tr> <tr><td>4</td><td>21</td></tr> <tr><td>5</td><td>19</td></tr> </table>	x	y	1	3	2	13	3	19	4	21	5	19

When you're done solving the problems on this handout, make sure you check your answers against the **correct answers below**.

1. The function is quadratic because it has a 2nd difference that is constant .	2. The function is linear because it has a 1st difference that is constant .
3. The function is linear because it has a 1st difference that is constant .	4. The function is quadratic because it has a 2nd difference that is constant .
5. The function is linear because it has a 1st difference that is constant .	6. The function is quadratic because it has a 2nd difference that is constant .
7. The function is quadratic because it has a 2nd difference that is constant .	8. $f(x) = 3x - 4$
9. $f(x) = -6x + 21$	10. $f(x) = 2x - 20$
11. $f(x) = 5x - 8$	12. $f(x) = -7x + 31$
13. $f(x) = 11x - 28$	14. $f(x) = 4x^2 - 19x + 25$
15. $f(x) = -x^2 + 8x - 15$	16. $f(x) = -3x^2 + 21x - 19$
17. $f(x) = -5x^2 + 24x - 33$	18. $f(x) = x^2 + x + 5$
19. $f(x) = -2x^2 + 16x - 11$
