

Writing Linear Equations from Graphs

In order to write the equation of a line, you need two things: the slope and a point. Then, you just plug that information into one of your two standard forms of a line (depending on what point you picked).

Slope-Intercept Form	Point-Slope Form
<p>If you pick the point on the y-axis (0, <u>b</u>), then you'll use:</p> $y = mx + b$ <p>where the slope is $m = \frac{\text{RISE}}{\text{RUN}}$, & the y-intercept is <u>b</u>.</p> <p>EXAMPLE:</p>  <p style="margin-left: 20px;"><i>The graph crosses the y-axis at (0, 6), so b = 6.</i></p> <p style="margin-left: 20px;"><i>Then, the graph moves down 5 units (RISE = -5) and right 2 units (RUN = 2) to the next perfect crossing.</i></p> <p style="margin-left: 20px;"><i>So, the slope is $m = \frac{\text{RISE}}{\text{RUN}} = \frac{-5}{2}$</i></p> <p>Now, just plug them in!</p> $y = mx + b$ $y = -\frac{5}{2}x + 6$	<p>If you pick any other point (perfect crossing on the grid) <u>THAT ISN'T ON THE Y-AXIS</u>, then you'll use:</p> $y - y_1 = m(x - x_1)$ <p>where the slope is $m = \frac{\text{RISE}}{\text{RUN}}$, & the point is (<u>$x_1$</u>, <u>$y_1$</u>).</p> <p>EXAMPLE:</p>  <p style="margin-left: 20px;"><i>The graph crosses perfectly at (2, 1), so (x_1, y_1) could be (2, 1). It could be <u>any</u> point you want.</i></p> <p style="margin-left: 20px;"><i>Then, the graph moves down 5 units (RISE = -5) and right 2 units (RUN = 2) to the next perfect crossing.</i></p> <p style="margin-left: 20px;"><i>So, the slope is $m = \frac{\text{RISE}}{\text{RUN}} = \frac{-5}{2}$</i></p> <p>Now, just plug them in!</p> $y - y_1 = m(x - x_1)$ $y - 1 = -\frac{5}{2}(x - 2)$

Write the equation of each graph in **slope-intercept form** to the left, and in **point-slope form** to the right.

SLOPE-INTERCEPT FORM	← GRAPH →	POINT-SLOPE FORM
<p>1. $y = mx + b$</p> <p>$b =$ _____</p> <p>$m = \frac{\text{RISE}}{\text{RUN}} =$ _____</p> <p>Equation: _____</p>		<p>2. $y - y_1 = m(x - x_1)$</p> <p>$(x_1, y_1) =$ _____</p> <p>$m = \frac{\text{RISE}}{\text{RUN}} =$ _____</p> <p>Equation: _____</p>

<p>13. $y = mx + b$</p> <p>$b =$ _____</p> <p>$m = \frac{RISE}{RUN} =$ _____</p> <p>Equation: _____</p>		<p>14. $y - y_1 = m(x - x_1)$</p> <p>$(x_1, y_1) =$ _____</p> <p>$m = \frac{RISE}{RUN} =$ _____</p> <p>Equation: _____</p>

Sometimes, you'll be working with horizontal ($y =$) or vertical ($x =$) lines, where either x or y is *constantly* one number. In that case, the line is either $\leftarrow y = \text{that number}$ or $\uparrow x = \text{that number}$.

<p>EXAMPLE:</p> <p>It's \leftarrow at 2, so... $y = 2$</p>	<p>15.</p> <p>_____ = _____</p>	<p>16.</p> <p>_____ = _____</p>
<p>EXAMPLE:</p> <p>It's \uparrow at -1, so... $x = -1$</p>	<p>17.</p> <p>_____ = _____</p>	<p>18.</p> <p>_____ = _____</p>
