

Triangle Congruence & Similarity
eg. 12 = 24 Size *same ~ shape*

I. Congruence vs. Similarity

A. Congruent means same in both size (equal) & shape (similar)

Sides are equal Angles are equal

B. Similar means same in shape (Dilation by scale factor)

Sides are PROPORTIONAL (equal fractions) Angles are equal

II. How to know triangles are...

<p style="text-align: center;"><u>Congruent</u></p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 5px auto;">At least 3 parts that are equal</div> <p>All 3 sides are the same OR 2 sides and 1 angle OR 2 angles and 1 side</p> <p>SSA & AAA don't work!</p>	<p style="text-align: center;"><u>Similar</u></p> <p>* All 3 sides are proportional</p> <p>OR</p> <p>* 2 sides & 1 angle (proportional) (equal)</p> <p>* Any 2 angles are equal</p>
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

III. How to prove triangles are...

<u>Congruent</u>	<u>Similar</u>
SSS - All 3 sides are the same	SSS - All 3 sides are proportional
SAS - 2 sides and 1 connecting angle are the same	SAS - 2 proportional sides and 1 connecting equal angle
ASA - 2 angles and 1 connecting side are the same	AA - any 2 angles are the same
AAS - 2 angles and 1 non-connecting side are the same	
HL - 2 sides and 1 non-connecting RIGHT angle are the same	

(SSA w/ right angle)

Example 1: Congruence

$\overline{BC} \cong \overline{DF}$
 $\angle A \cong \angle E$
 $\angle B \cong \angle D$

Yes! by AAS or ASA connects them

Example 2: Congruence

$\overline{LN} \cong \overline{QN}$
 $\overline{MN} = \overline{PN}$
 $\angle LNM \cong \angle QNP$

2 sides & 1 angle
 SSA or SAS
 yes!

IV. Similar - How to find the scale factor:

A. Create proportions for the sides

$\frac{\text{Small Side 1}}{\text{Small Side 2}}$	→	$\frac{\text{Medium 1}}{\text{Medium 2}}$	→	$\frac{\text{Large 1}}{\text{Large 2}}$
---------------------------------------------------	---	-------------------------------------------	---	-----------------------------------------

from same Δ

B. If they are similar, all of the fractions will be equal (the sides are proportional). That fraction is the scale factor.

Example 3: Similarity

Looks Like:
3 labeled side pairs
Angles
maybe SSS
So... check

	S_n	M_x	L_y
$\Delta 1$	$\frac{12 \div 3}{15 \div 3} = \frac{4}{5}$	$\frac{28 \div 7}{35 \div 7} = \frac{4}{5}$	$\frac{36 \div 9}{45 \div 9} = \frac{4}{5}$

$\frac{4}{5} = \frac{4}{5} = \frac{4}{5}$

\sim by SSS

Example 4: Similarity

Looks Like
1 angle
2 sides
SAS or SSA
Not ~

	Smaller	larger
$\Delta 1$	$\frac{10 \div 2}{12 \div 2} = \frac{5}{6}$	$\frac{16 \div 4}{20 \div 4} = \frac{4}{5}$

$\frac{5}{6} \neq \frac{4}{5}$

Not ~

Example 5: Similarity

vertical
2 angle pairs
AA

\sim by AA
